

RAAHI

Scroll-Linked Frame-Sequence Hero — Corrected Prompt (v2)

Implementation brief for Antigravity / any AI coding agent | Livelihood Setu, PM-AJAY GIA MVP

CORRECTION FROM v1: this is not an autoplaying loop. A real 240-frame illustrated sequence has already been produced and is attached as source frames. The animation must be scroll-linked: the rider moves forward as the user scrolls down, and the call to RAAHI completes only once the user reaches the end of the scroll.

ACT AS:

A world-class Creative Developer and Brand Experience Director, specializing in Apple-style scroll-based storytelling and HTML5 Canvas image-sequence playback — the same scrollytelling mechanic used for premium product-reveal pages, applied here to a civic-tech, human-story hero for rural India.

THE TASK:

Implement the RAAHI hero section as a **scroll-scrubbed image sequence**, using the exact 240-frame illustrated sequence already produced (attached, **frame_000** through **frame_239**, 800×450 JPG, exported from a source animation at ~24fps). Do not generate new artwork and do not autoplay the sequence on a timer. The frame shown at any moment is a direct function of scroll position: as the user scrolls down, the rider advances forward along the road; scrolling up reverses him. The story only completes — the call connects and the welcome screen appears — once the user has scrolled through to the end.

THE SOURCE SEQUENCE (WHAT ACTUALLY HAPPENS, FRAME BY FRAME):

The attached frames already tell the whole story. Do not reinterpret or invent new beats — map the scrollbar to this exact sequence:

- **frame_000** — rider fully in view, side profile, open golden paddy fields, bright midday sun, blue sky. The establishing hero shot.
- **frame_001–098** — forward riding motion along a dirt road through the fields; the camera holds behind/beside him as the landscape scrolls past.
- **frame_099–118** — Ganesh General Store comes into view; as he closes in, a **“Raahi” poster on the store wall** becomes legible — this is the ad-discovery beat (there is no roadside billboard in the real asset — the ad lives on the shop wall).
- **frame_119–139** — he arrives, dismounts, parks the bike, and walks toward the store, back to camera.
- **frame_140–159** — standing by the store, he takes out his phone; the dialer begins to appear on screen.
- **frame_160–178** — close-up on the phone: the keypad is visible, the helpline number **1800-XXXXXXX** is dialed digit by digit, thumb moves toward the green call button.
- **frame_179–214** — the call connects: the screen transitions to a pulsing orange concentric-ring “connecting/listening” animation.
- **frame_215–239** — the ring animation settles and holds on the final screen: “नमस्ते, राही में स्वागत है” (“Hello, welcome to RAAHI”) with an active call bar at the bottom. This is the resting state at 100% scroll.

VISUAL DIRECTION & PALETTE (CORRECTED TO MATCH THE REAL FOOTAGE):

Ignore any earlier “dusk indigo” direction. The actual sequence is a **bright, warm daytime** rural scene — clear-sky midday light, not sunset. Sample exact values directly from the source frames when implementing; characteristic tones are:

	Approx. hex	Where it appears
	#A9D8E6	Sky
	#B7A63E	Paddy / wheat fields
	#E4D9BE	Store plaster wall
	#3E7CA6	Store awning
	#6E2A28	Motorcycle
	#E8801F	RAAHI accent — poster logotype, dial button, connecting rings

The single accent colour — warm orange — is already doing the branding work inside the footage itself (poster logotype, dial button, ring animation). Carry that same orange into the CTA button and nav highlight so the UI chrome feels like it belongs to the same world as the footage, rather than fighting it.

Typography stays as previously specified: **Baloo 2** for the RAAHI wordmark/headlines, **Hind** for body copy and captions (Latin + Devanagari).

CORE INTERACTION: SCROLL-SCRUBBED IMAGE SEQUENCE

- A full-viewport HTML5 Canvas is pinned/sticky for the duration of the sequence (section height ≈ 500–600vh, so there is room to scroll comfortably through 240 distinct frames without them flying past too fast).
- Frame index = a smooth, clamped function of scroll progress within that pinned section: **frameIndex = Math.floor(scrollProgress * 239)**. No easing lag on the frame draw itself — it should feel directly, physically tied to the scrollbar, the way the wheel of a film reel is tied to your hand.
- Preload all 240 frames (or a resolution-appropriate set) before enabling scroll-scrub, with a lightweight loader state, so there is no flicker or pop-in on first scroll.
- Scrolling down = the rider moves forward, the story advances toward the call. Scrolling up = the sequence plays in reverse, exactly as filmed. The mechanic must feel reversible and scrubbable, not like a one-shot video.
- The canvas draws each JPG letterboxed/cropped to always fill the viewport at the source 800×450 aspect ratio, centered, no distortion.

SCROLL LOGIC & COPY OVERLAYS (0–100%):

Text overlays float above the canvas and change with scroll position, synchronized to the frame ranges above:

0–15% · frames 000–035 — HERO

Centered, bold: “**RAAHI**”, subtitle “**Your path, your earning.**” Small supporting line: “A livelihood counsellor, one phone call away.”

15–40% · frames 036–098 — THE ROAD

Left-aligned, fades in as he rides: **“No forms. No apps. No reading required.”** Subcopy: “Just a road, a phone number, and someone who listens in your own language.”

40–55% · frames 099–118 — THE DISCOVERY

Right-aligned, timed to the poster becoming legible on the wall: **“Help was always this close.”** Subcopy: “RAAHI listens, understands, and finds the training that fits your life.”

55–65% · frames 119–139 — THE STOP

Copy recedes to near-silence here — let the dismount and walk breathe with minimal or no text, so the moment of decision reads visually.

65–80% · frames 140–178 — THE CALL

Centered, smaller, matched to the dialer: **“One call. Eight questions. Three paths forward.”**

80–100% · frames 179–239 — CONNECTED

Centered, strong, timed to the ring animation and welcome screen: “नमस्ते, राही में स्वागत है” — **Hello, welcome to RAAHI.** Primary CTA fades in and stays pinned once 100% is reached: **“Call RAAHI — 1800-XXXXXXX”**, orange, large tap target.

NAVBAR:

Keep the earlier Apple-style minimal nav (wordmark left, links center, CTA right), but adapt contrast to the bright footage: a subtle dark gradient scrim across the very top of the canvas (transparent to ~20% black) keeps white nav text legible over the sky in every frame, without the heavy glassmorphism treatment fighting the illustration's flat style below it. Nav fades in after a small scroll, exactly as before.

TECH STACK INTENT (FOR BEHAVIOUR, NOT LITERAL CODE):

- Framework: Next.js (App Router mental model).
- Canvas: native HTML5 Canvas 2D context drawing the current frame image on each scroll tick, driven by a scroll listener or IntersectionObserver + rAF, not Framer Motion's declarative animation — this needs direct scroll-to-frame mapping, the same mechanic Apple product pages use for their image-sequence heroes.
- Overlays: Framer Motion-style fade/slide is fine for the floating text and nav, since those are time-based transitions layered on top of the frame-driven canvas, not the canvas itself.
- Assets: serve the 240 JPGs from /public/frames/ (or a CDN), consider a smaller preview/blurred placeholder set for slow connections given the end audience.

FINAL PROMPT (COMBINED, READY-TO-USE):

“Build the RAAHI hero section as a scroll-scrubbed HTML5 Canvas image sequence, using the attached 240-frame source sequence (frame_000.jpg through frame_239.jpg, 800×450, already produced — do not generate new artwork). Pin the canvas full-viewport for a 500–600vh section and map frame index directly and reversibly to scroll progress ($\text{frameIndex} = \text{floor}(\text{scrollProgress} \times 239)$), so scrolling down moves the rider forward down the road and scrolling up reverses him, with no autoplay and no timer-driven animation. Preload all frames before enabling scrub to avoid flicker. The sequence itself tells the story: 0–15% is the hero establishing shot of the rider on an open road through golden paddy fields under a bright midday sky; 15–40% is forward riding motion as the landscape scrolls

past; 40–55% is the approach to Ganesh General Store, where a ‘Raahi’ poster on the shop wall becomes legible — the ad-discovery beat; 55–65% is the dismount and walk to the store; 65–80% is a phone close-up where he dials the helpline number digit by digit; and 80–100% is the call connecting, resolving into a pulsing orange ring animation and a held welcome screen reading ‘नमस्ते, राही में स्वागत है’ (Hello, welcome to RAAHI). Layer floating text overlays above the canvas, faded and slid in with Framer Motion-style transitions synchronized to those same scroll ranges, using Baloo 2 for headlines and Hind for body/captions in both Hindi and English. Match the palette to the real footage — bright sky blue, warm gold-green fields, cream store plaster, a maroon motorcycle, and a single warm-orange accent (already present in the footage's poster and phone UI) reused consistently in the CTA button, nav highlight, and any UI chrome. Add a subtle dark gradient scrim at the very top of the canvas so a minimal Apple-style nav (wordmark left, links center, CTA right) stays legible over the bright sky in every frame. Once scroll reaches 100%, pin a primary CTA reading ‘Call RAAHI — 1800-XXXXXXX’ in the accent orange. The whole mechanic should feel exactly like an Apple product-reveal scrollytelling page — direct, physical, scrubbable — but telling a human, civic story instead of a product spec.”

v2 — corrects the scroll mechanic per the real 240-frame sequence supplied by the user. RAAHI · Livelihood Setu · PM-AJAY GIA MVP (FR-01–FR-10)
